flexibility: Can be deployed in a Simple or Highly Available Cluster deployment. Recommended deployment is a HA Cluster… Simple deployment is for test/dev environments, it is not for production use cases."

By contrast, HA/clustered models increase resources to provide redundancy at scale. Since the requirement is the smallest resource footprint, the Simple model is the correct selection.

(Stretched/Continuous Availability options are not listed VCF Operations models in this context.)

6.An administrator is tasked to deploy a new vSAN Storage Cluster to an existing VCF instance. The VCF instance is deployed as a single workload domain.

What must the administrator do to achieve this without deploying additional management components?

A. Deploy an additional VCF instance and workload domain with a vSAN storage cluster.

B. Deploy additional hosts as vSAN storage-only nodes within the existing cluster.

C. Deploy a second cluster as a vSAN storage cluster in the existing workload domain.

D. Deploy an additional workload domain with a vSAN storage cluster within the existing VCF instance.

Answer: C

Explanation:

Comprehensive and Detailed

The VCF 9.0 Architecture and Deployment Guide explains that within a single Workload Domain, administrators can scale resources by adding additional clusters, including compute or vSAN storage clusters. Specifically, "A Workload Domain can contain multiple clusters. You can deploy a new cluster, such as a vSAN cluster, into an existing domain without introducing new management components." . Options A and D both introduce new workload domains or VCF instances, which require their own management stack (vCenter, NSX Manager, etc.) and are unnecessary in this scenario. Option B is incorrect because "vSAN storage-only nodes" are supported in vSAN but are not the method for adding a new cluster within VCF automation. The correct approach is deploying a second cluster inside the same workload domain—this reuses the existing management components while meeting the requirement for a new vSAN storage cluster.

7.Which two types of group can be created to collect and manage objects in Istio Service Mesh? (Choose two.)

A. Security

B. Cluster

C. Service

D. API

E. Node

Answer: B, C

Explanation:

Comprehensive and Detailed

The Istio integration in VCF 9.0 defines two main logical groupings for organizing workloads within a service mesh: Cluster groups and Service groups. The documentation notes: "Cluster groups allow you to organize and manage objects across different Kubernetes clusters. Service groups let you aggregate and manage services that share common policies, routing rules, or observability requirements." .

These groups enable administrators to apply consistent service mesh policies across multiple deployments and clusters. They also simplify administration by centralizing traffic management, routing,
