2025 Accurate CCRN-Pediatric – 100% Free Latest Learning Material | Vce CCRN-Pediatric Format

Consider sitting for an Critical Care Nursing Exam exam and discovering that the practice materials you've been using are incorrect and useless. The technical staff at TestsDumps has gone through the AACN certification process and knows the need to be realistic and exact. Hundreds of professionals worldwide examine and test every AACN CCRN-Pediatric Practice Exam regularly. These practice tools are developed by professionals who work in fields impacting AACN Critical Care Nursing Exam, giving them a foundation of knowledge and actual competence.

AACN Critical Care Nursing Exam Sample Questions (Q78-Q83):

NEW QUESTION # 78

An irritable child has an acute fever, conjunctivitis, rash, and a strawberry tongue. A prolonged PR interval is observed on the ECG monitor. These findings are most likely due to:

- A. Hypertrophic cardiomyopathy

- B. Rheumatic heart disease
- **C. Kawasaki disease**
- D. Pericarditis

Answer: C

Explanation:

Kawasaki disease is an acute vasculitis that primarily affects children under 5 and presents with classic signs: fever, rash, conjunctivitis, strawberry tongue, and extremity changes. It may also cause coronary artery aneurysms and conduction abnormalities, such as PR prolongation.

"Kawasaki disease presents with mucocutaneous inflammation, and cardiac complications may include myocarditis and conduction delays, such as first-degree AV block." (Referenced from CCRN Pediatric - Direct Care: Cardiovascular, Inflammatory Heart Disease)

NEW QUESTION # 79

While ventilating with 100% FiO₂ via Ambu bag, an intubated child desaturates. Breath sounds are decreased in all fields. What is the best action?

- **A. Obtain a chest x-ray and ABG**
- B. Administer a bronchodilator
- C. Extubate and bag-mask ventilate
- D. Continue ventilating with Ambu bag

Answer: A

Explanation:

A sudden drop in oxygen saturation with diminished breath sounds bilaterally suggests a possible ET tube issue, pneumothorax, or mucus plug. A chest x-ray is the most appropriate immediate step to identify the cause, and an ABG can assess ventilation status.

"Sudden desaturation in an intubated patient warrants immediate imaging and gas exchange assessment to identify pneumothorax, malpositioned tube, or obstruction." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Emergency Airway Complications)

NEW QUESTION # 80

A child was struck by an automobile 24 hours ago. There is an ICP monitor in place which has a spontaneous rise in ICP to 35 mm Hg. A nurse medicates the patient with analgesia and sedative, but the ICP remains elevated. Which of the following should be the next intervention?

- A. Increase the benzodiazepine infusion
- B. Include a narcotic infusion
- C. Induce a pentobarbital coma
- **D. Administer a hypertonic saline solution**

Answer: D

Explanation:

Intracranial pressure (ICP) above 20-25 mm Hg is abnormal, and 35 mm Hg is a critical level requiring urgent intervention. After sedation and analgesia fail to reduce ICP, osmotic therapy is the next step, with hypertonic saline being a frontline choice for its rapid effect in reducing cerebral edema.

"In patients with traumatic brain injury and elevated ICP, first-line therapies include sedation, analgesia, and head positioning. If ineffective, hyperosmolar therapy such as hypertonic saline or mannitol is indicated to decrease cerebral edema and reduce ICP." (Referenced from CCRN Pediatric - Direct Care: Neurologic Dysfunction and Intracranial Hypertension Management) Hypertonic saline pulls fluid from the brain into the vascular space, lowering ICP and improving cerebral perfusion.

NEW QUESTION # 81

A child possibly has pinworm infestation because he reported that he first felt:

- A. maculopapular rash
- **B. anal itching**

- C. loose bowel movement
- D. scaly skin patches

Answer: B

Explanation:

Explanation: With enterobiasis, the adult worm lays her eggs around the anal opening, producing an irritation and thus an itch.

NEW QUESTION # 82

Michael was diagnosed with Wilms tumor and started on chemotherapy as treatment. The doctor ordered a Dactinomycin 0.015mg/kg slow IV push now. The nurse on duty should:

- A. administer the medicine and watch out for nausea and vomiting.
- B. administer the medicine then give hydrocortisone 100 mg IV afterwards.
- C. hold the medication until the doctor changed the dosage.
- D. question the doctor's order to prevent over dosage.

Answer: A

Explanation:

Explanation: The nurse should administer the medicine and watch out for nausea and vomiting. The dosage is safe for a pediatric client, we can administer until 1.5mg in 3 weeks time. Dactinomycin may cause nausea, vomiting, diarrhea and stomatitis.

NEW QUESTION # 83

.....

Where there is life, there is hope. Never abandon yourself. You still have many opportunities to counterattack. If you are lack of knowledge and skills, our CCRN-Pediatric guide questions are willing to offer you some help. Actually, we are glad that our CCRN-Pediatric Study Materials are able to become your top choice. Just look at the warm feedbacks from our CCRN-Pediatric learning braindumps, we are very popular in the whole market. And our CCRN-Pediatric exam guide won't let you down.
