WGU Web Development Applications Sample Questions (Q71-Q76):

NEW QUESTION # 71

Given the following code:

```
html
Copy
Edit
<!DOCTYPE html>
<html>
<head>
<style>
p { font-family: Georgia, serif; }
</style>
</head>
<body>
<h1>The font-family Property</h1>
<p>The quick brown fox jumps over the lazy dog.</p>
</body>
</html>
```

Which CSS rule would ensure the heading displays at 16pt size?

- A. `h1 { font-size: 16pt; }`
- B. `#h1 { font-size: 16pt; }`
- C. `h1 { text-size: 16pt; }`
- D. `#h1 { text-size: 16pt; }`

Answer: A

Explanation:

To style an `<h1>` tag, you use the element selector `h1`, and to define the size of the font, use the `font-size` property. The `text-size` property does not exist in CSS.

Correct rule:

```
h1 {
font-size: 16pt;
}
```

"The `font-size` property sets the size of the font. Use element selectors (like `h1`) to apply styles to all elements of that type."

NEW QUESTION # 72

Which of the following best describes the programming paradigm of JavaScript?

- A. Object-based
- B. Function-driven
- C. Object-oriented
- D. Event-driven

Answer: A

Explanation:

JavaScript is often described as an object-based language, meaning it is centered around objects. While it supports object-oriented programming (OOP) concepts, it is more accurate to describe it as object-based due to its prototypal inheritance model rather than classical inheritance.

* Object-Based: JavaScript is built around objects and supports the creation and manipulation of objects.

* Object-Oriented Features: JavaScript supports OOP principles like encapsulation, inheritance, and polymorphism, but through prototype chains rather than class-based inheritance.

* Functional and Event-Driven: JavaScript supports functional programming and is often used in an event-driven manner, particularly in the context of web browsers.

NEW QUESTION # 73

Which attribute should a developer add to an HTML element to enable the HTML5 drag-and-drop application programming interface (API)?

- A. ondragover
- **B. draggable**
- C. dragstart
- D. ondragstart

Answer: B

Explanation:

> "The `draggable` attribute is a global attribute in HTML5 that indicates whether an element is draggable.

When set to `true`, the element becomes draggable using the drag-and-drop API." Example:

```
```html
<div draggable="true">Drag me</div>
```
```

* `ondragover` and `ondragstart` are event handlers, not attributes enabling drag.

* `dragstart` is an event, not an attribute.

NEW QUESTION # 74

Given the following markup:

```
```html
<p>This is sample text </p>
```
```

Which style positions the image to the left of the paragraph?

- A. clear: left;
- B. left: 10px;
- C. left: -10px;
- **D. float: left;**

Answer: D

Explanation:

> "The `float` property is used for positioning and formatting content. When you apply `float: left;` to an image, the image is moved to the left, and inline content (like text) will wrap around it." The other options (A and D) use `left`, which only applies to positioned elements (requires `position: relative`/`absolute`/`fixed`). Option B (`clear: left;`) prevents floating elements on the left but does not cause floating.

NEW QUESTION # 75

Given the following HTML statement:

```
```html
<div class="example">Example</div>
```
```

Which CSS rule hides the `

` tag when the browser's width is 600 pixels wide or less?

- A.

```
```css
@media screen and (max-width: 600px) {
 div.example {
 display: none;
 }
}
```
```
- B.

```
```css
@media screen and (min-resolution: 600px) {
 div.example {
 display: none;
 }
}
```
```
- C.

```
```css
@media screen and (max-resolution: 600px) {
 div.example {
 display: none;
 }
}
```
```
- D.

```
```css
@media screen and (min-width: 600px) {
 div.example {
 display: none;
 }
}
```
```

Answer: A

Explanation:

> "The ``@media`` rule with ``max-width: 600px`` targets devices with a screen width of 600 pixels or less. The associated style ``display: none;`` hides the element when that condition is met." References:
