Maximizing Your Study Time: CISSP Practice Questions and Study Tips

To earn CISSP (Certified Information Systems Security Professional) status? Congratulations on achieving this important step in your career in cybersecurity! Achieving CISSP certification demonstrates your expertise in information security and opens doors to numerous career opportunities. However, preparing for the CISSP exam is no small feat. It requires dedication, a structured study plan, and the right resources, including [CISSP practice questions](#).

This comprehensive guidance will examine the crucial part that CISSP practice questions play in your study routine and offer helpful study advice to help you get the most out of your study time.

The Significance of CISSP Practice Questions

Before we delve into study tips, it's crucial to understand why CISSP practice questions are a vital component of your exam preparation.

1. Assessing Your Knowledge: CISSP practice questions allow you to evaluate your understanding of the exam domains. They help you identify your strengths

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q977-Q982):

NEW QUESTION # 977

What are the primary goals of intrusion detection systems? (Select all that apply.)

- A. All of the choices
- B. Availability
- C. Accountability
- D. Response

Answer: C,D

Explanation:

Although there are many goals associated with security mechanisms in general, there are two overarching goals usually stated for intrusion detection systems. Accountability is the capability to link a given activity or event back to the party responsible for initiating it. This is essential in cases where one wishes to bring criminal charges against an attacker. The goal statement associated with accountability is: "I can deal with security attacks that occur on my systems as long as I know who did it (and where to find them)." Accountability is difficult in TCP/IP networks, where the protocols allow attackers to forge the identity of source addresses or other source identifiers. It is also extremely difficult to enforce accountability in any system that employs weak identification and authentication mechanisms. Response is the capability to recognize a given activity or event as an attack and then taking action to block or otherwise affect its ultimate goal. The goal statement associated with response is "I don't care who attacks my system as long as I can recognize that the attack is taking place and block it." Note that the requirements of detection are quite different for response than for accountability.

NEW QUESTION # 978

What is the correct sequence which enables an authorized agency to use the Law Enforcement Access Field (LEAF) to decrypt a message sent by using the Clipper Chip? The following designations are used for the respective keys involved K_f, the family key; K_s, the session key; U, a unique identifier for each Clipper Chip and K_u, the unit key that is unique to each Clipper Chip.

- A. Obtain a court order to acquire the family key, K_f; recover U and K_u; then recover K_s, the session key. Use the session key to decrypt the message.
- B. Obtain a court order to acquire the two halves of K_u, the unit key. Recover K_u. Decrypt the LEAF with K_u and then recover K_s, the session key. Use the session key to decrypt the message.
- C. Decrypt the LEAF with the family key, K_f; recover U; obtain a court order to obtain the two halves of K_u; recover K_u; and then recover K_s, the session key. Use the session key to decrypt the message.
- D. Decrypt the LEAF with the family key, K_f; recover U; obtain a court order to obtain K_s, the session key. Use the session key to decrypt the message.

Answer: C

Explanation:

The explanation is based on the LEAF as shown in the Figure.

image018

The message is encrypted with the symmetric session key, K_s. In order to decrypt the message, then, K_s must be recovered. The LEAF contains the session key, but the LEAF is encrypted with the family key, K_f, that is common to all Clipper Chips. The authorized agency has

access to K_f and decrypts the LEAF. However, the session key is still encrypted by the 80-bit unit key, K_u, that is unique to each Clipper Chip and is identified by the unique identifier, U. K_u is divided into two halves, and each half is deposited with an escrow agency. The law enforcement agency obtains the two halves of K_u by presenting the escrow agencies with a court order for the key identified by U.

The two halves of the key obtained by the court order are XORed together to obtain K_u. Then, K_u is used to recover the session key, K_s, and K_s is used to decrypt the message.

The decryption sequence to obtain K_s can be summarized as:

$$K_f \rightarrow U \rightarrow [1/2 K_u \text{ XOR } 1/2 K_u] \rightarrow K_u \rightarrow K_s$$

image020

This is the sequence described in answer "Decrypt the LEAF with the family key, K_f; recover U; obtain a court order to obtain the two halves of K_u; recover K_u; and then recover

K_s,

the session key. Use the session key to decrypt the message". The sequences described in the other answers are incorrect.

NEW QUESTION # 979

Which of the following describes the major disadvantage of many Single Sign-On (SSO) implementations?

- A. The initial logon process is cumbersome to discourage potential intruders.
- B. Once a user obtains access to the system through the initial log-on, he has to logout from all other systems
- C. Once an individual obtains access to the system through the initial log-on, they have access to all resources within the environment that the account has access to.
- D. Once a user obtains access to the system through the initial log-on, they only need to logon to some applications.

Answer: C

Explanation:

Single Sign-On is a distributed Access Control methodology where an individual only has to authenticate once and would have access to all primary and secondary network domains. The individual would not be required to re-authenticate when they needed additional resources. The security issue that this creates is if a fraudster is able to compromise those credential they too would have access to all the resources that account has access to. All the other answers are incorrect as they are distractors.

NEW QUESTION # 980

What is the FIRST step in developing a security test and its evaluation?

- A. Identify all applicable security requirements
- B. Determine testing methods
- C. Identify people, processes, and products not in compliance
- D. Develop testing procedures

Answer: A

NEW QUESTION # 981

Which of the following is a drawback of Network-based IDSs?

- A. It is not effective.
- **B. It cannot analyze encrypted information.**
- C. It is very costly to setup.
- D. It is very costly to manage.

Answer: B

Explanation:

Network-based IDSs cannot analyze encrypted information. This problem is increasing as more organizations (and attackers) use virtual private networks. Most network-based IDSs cannot tell whether or not an attack was successful; they can only discern that an attack was initiated. This means that after a network-based IDS detects an attack, administrators must manually investigate each attacked host to determine whether it was indeed penetrated.
