100% Pass Quiz WGU - Accurate Network-and-Security-Foundation - New Network-and-Security-Foundation Test Review

The development of science and technology makes our life more comfortable and convenient, which also brings us more challenges. Many company requests candidates not only have work experiences, but also some professional certifications. Therefore it is necessary to get a professional Network-and-Security-Foundation Certification to pave the way for a better future. Considered

many of the candidates are too busy to review, our experts designed the Network-and-Security-Foundation question dumps in accord with actual examination questions, which would help you pass the exam with high proficiency.

WGU Network-and-Security-Foundation Sample Questions (Q26-Q31):

NEW QUESTION # 26

Which statement describes the Integrity tenet of IT security?

- A. It involves transmitting network data without any errors.
- B. It involves keeping systems accessible for network users.
- C. It requires the encryption of sensitive data transmission.
- D. It requires that network applications be accessible to users.

Answer: A

Explanation:

Integrity in IT security ensures that data remains accurate, unaltered, and trustworthy throughout its lifecycle.

This means that data transmission should occur without errors and should not be modified by unauthorized parties. Mechanisms like checksums, hashing, and digital signatures help maintain integrity.

* Encryption (B) enhances confidentiality, not integrity.

* Accessibility (C and D) relates to availability, not integrity.

NEW QUESTION # 27

An organization does not have controls in place to limit employee access to sensitive customer data.

What is a component of the CIA triad that is violated?

- A. Interpretation
- B. Availability
- C. Integrity
- D. Confidentiality

Answer: D

Explanation:

Confidentiality ensures that only authorized users have access to sensitive information. Without proper access controls, employees may be able to view or modify sensitive data without proper authorization, leading to a confidentiality breach.

* Integrity involves protecting data from unauthorized modifications.

* Availability ensures that systems remain operational.

* Interpretation is not part of the CIA triad.

NEW QUESTION # 28

An organization is the victim of an attack in which an attacker intercepts messages between two parties before transferring them to the correct destination.

What is the type of cyberattack described in this scenario?

- A. Pharming
- B. Man-in-the-middle attack
- C. Credential stuffing
- D. Social engineering

Answer: B

Explanation:

A man-in-the-middle (MITM) attack occurs when an attacker secretly intercepts and relays communication between two parties.

This allows the attacker to steal data, modify messages, or inject malicious content without the victims' knowledge.

* Credential stuffing reuses stolen login credentials but does not involve interception.

* Social engineering manipulates users rather than intercepting messages.

* Pharming redirects users to fraudulent websites, but it does not intercept communication.

NEW QUESTION # 29

An organization has experienced a series of data breaches and needs to ensure that data remains protected even if intercepted. Which security measure should be implemented?

- A. Role-based access control (RBAC)
- B. Two-factor authentication (2FA)
- C. Data encryption
- D. Patch management

Answer: C

Explanation:

Data encryption protects sensitive information by encoding it into an unreadable format, ensuring that even if attackers intercept the data, they cannot decipher it without the proper decryption key. This is crucial for protecting stored and transmitted data.

* RBAC controls user access but does not secure data in transit.

* 2FA strengthens authentication but does not secure stored or transmitted data.

* Patch management fixes software vulnerabilities but does not directly protect intercepted data.

NEW QUESTION # 30

An individual has been tasked with setting up an office network. During the process, there is a need for a device that extends the range of a network.

Which device should be used?

- A. Server
- B. Router
- C. Switch
- D. Access point

Answer: D

Explanation:

An access point (AP) is a network device that extends the coverage of a wireless network by acting as a bridge between wired and wireless devices. It allows users to connect to a network without needing a direct wired connection. APs are particularly useful in large office spaces where Wi-Fi signals may not reach all areas.

* Routers primarily manage network traffic but do not directly extend network range unless they include built-in AP functionality.

* Servers are used for hosting applications and storing data but do not extend network connectivity.

* Switches connect wired devices within a local network but do not extend wireless network range.

NEW QUESTION # 31

.....

The RealExamFree Network-and-Security-Foundation exam questions are checked and verified by experienced and qualified Network-and-Security-Foundation exam trainers. So you can trust on the validity and top standard of RealExamFree Network-and-Security-Foundation exam practice test questions. With the RealExamFree Network-and-Security-Foundation exam questions you will get everything that you need to prepare and pass the challenging WGU Network-and-Security-Foundation Exam with good scores. The RealExamFree Network-and-Security-Foundation exam questions will give you an idea about the final Network-and-Security-Foundation exam format and you will get experience about Network-and-Security-Foundation exam format before the final exam.
