Our Network-and-Security-Foundation learning guide is very efficient tool in the world. As is known to us, in our modern world, everyone is looking for to do things faster, better, smarter, so it is no wonder that productivity hacks are incredibly popular. So we must be aware of the importance of the study tool. In order to promote the learning efficiency of our customers, our Network-and-Security-Foundation Training Materials were designed by a lot of experts from our company. You can totally rely on our Network-and-Security-Foundation study materials.

TestValid Network-and-Security-Foundation Certification Exam come in three different formats so that the users can choose their desired design and prepare Network-and-Security-Foundation (Network-and-Security-Foundation) exam according to their needs. The first we will discuss here is the PDF file of real Network-and-Security-Foundation (Network-and-Security-Foundation) exam questions. It can be taken to any place via laptops, tablets, and smartphones. In addition, you can print these Network-and-Security-Foundation (Network-and-Security-Foundation) PDF questions for paper study in this format of TestValid product frees you from restrictions of time and place as you can study Network-and-Security-Foundation exam questions from your comfort zone in your spare time.

WGU Network-and-Security-Foundation Sample Questions (Q12-Q17):

NEW QUESTION # 12

A company is specifically worried about rogue access points.

Which strategy should be used as a mitigation against this type of attack?

- A. Monitor normal traffic patterns
- B. Disable unnecessary services
- C. Decrease the wireless range

- **D. Configure switch port tracing**

Answer: D

Explanation:

Configuring switch port tracing helps detect unauthorized devices, such as rogue access points, that are connected to the network. Network administrators can use port security and intrusion detection systems (IDS) to monitor and block unauthorized access points.

- * Decreasing wireless range may limit exposure but does not actively detect rogue APs.
- * Disabling unnecessary services improves security but does not prevent rogue APs.
- * Monitoring traffic patterns helps detect anomalies but does not directly stop rogue APs.

NEW QUESTION # 13

A company is specifically worried about buffer overflow attacks.

Which strategy should be used as a mitigation against this type of attack?

- A. Disable caching
- B. Use server-side validation
- **C. Detect code vulnerabilities**
- D. Implement intrusion protection software

Answer: C

Explanation:

Detecting code vulnerabilities through regular security audits, code reviews, and static analysis tools helps prevent buffer overflow attacks. Developers should implement bounds checking, memory-safe programming languages, and input validation to mitigate risks.

- * Disabling caching does not prevent buffer overflow attacks.
- * Server-side validation helps with input security but does not directly address buffer overflows.
- * Intrusion protection software may detect attacks but does not prevent vulnerabilities in code.

NEW QUESTION # 14

What is the component of the CIA triad for IT security that requires that IP packets be retransmitted if the receiving host has an invalid checksum value?

- A. Confidentiality
- B. Availability
- C. Consistency
- **D. Integrity**

Answer: D

Explanation:

Integrity in the CIA (Confidentiality, Integrity, Availability) triad ensures that data is not altered in an unauthorized manner. In networking, integrity mechanisms such as checksums, message authentication codes (MACs), and digital signatures verify that transmitted data has not been tampered with. If an IP packet has an invalid checksum, the system detects corruption and requests retransmission, ensuring data integrity.

- * Confidentiality protects against unauthorized access but does not ensure data consistency.
- * Availability ensures that resources are accessible but does not verify data correctness.
- * Consistency is not a formal component of the CIA triad.

NEW QUESTION # 15

An organization is updating its information security policies in order to comply with the Personal Information Protection and Electronic Documents Act (PIPEDA).

What should this organization expect to be required under this legislation?

- A. Notify individuals each time their personal information is viewed
- **B. Securely dispose of personally identifiable information**
- C. Disclose the software used to protect personal data
- D. Compensate individuals for revenue from the sale of their information

Answer: B

Explanation:

PIPEDA requires businesses in Canada to protect personal information through security measures and proper disposal practices. This includes secure deletion of personal data when no longer needed to prevent unauthorized access.

- * Compensating individuals for data sales is not a legal requirement.
- * Notifying individuals of each data access is unnecessary unless required by a breach.
- * Disclosing security software is not mandated by PIPEDA.

NEW QUESTION # 16

An organization is the victim of an attack in which an attacker targets a computer to use as a tool to infect and target other computers in a larger attack.

What is the purpose of this attack?

- A. Data modification
- **B. Launch point**
- C. Data export
- D. Denial of availability

Answer: B

Explanation:

A launch point attack occurs when an attacker compromises a system and uses it as a foothold to spread malware, conduct reconnaissance, or launch further attacks against other systems. Botnets and command-and-control (C2) servers operate this way.

- * Denial of availability disrupts service, but does not spread attacks.
- * Data export steals data instead of launching further attacks.
- * Data modification changes existing information but does not involve propagating threats.
