Fast2test has been designing and offering real WGU WGU Secure Software Design (KEO1) Exam exam dumps for many years. We regularly update our valid WGU Secure-Software-Design certification test preparation material to keep them in line with the current WGU Secure Software Design (KEO1) Exam (Secure-Software-Design) exam content and industry standards. Professionals from different countries give us their valuable feedback to refine Secure-Software-Design actual dumps even more.

### WGU Secure Software Design (KEO1) Exam Sample Questions (Q69-Q74):

#### NEW QUESTION # 69

While performing functional testing of the new product from a shared machine, a QA analyst closed their browser window but did not logout of the application. A different QA analyst accessed the application an hour later and was not prompted to login. They then noticed the previous analyst was still logged into the application.

How should existing security controls be adjusted to prevent this in the future?

- A. Ensure no sensitive information is stored in plain text in cookies
- B. Ensure role-based access control is enforced for access to all resources
- C. Ensure strong password policies are enforced
- **D. Ensure user sessions timeout after short intervals**

**Answer: D**

Explanation:

The issue described involves a session management vulnerability where the user's session remains active even after the browser window is closed, allowing another user on the same machine to access the application without logging in. To prevent this security risk, it's essential to adjust the session management controls to include an automatic timeout feature. This means that after a period of inactivity, or when the browser window is closed, the session should automatically expire, requiring a new login to access the application. This adjustment ensures that even if a user forgets to log out, their session won't remain active indefinitely, reducing the risk of unauthorized access.

References:

\* Secure SDLC practices emphasize the importance of security at every stage of the software development life cycle, including the implementation of proper session management controls<sup>12</sup>.

\* Best practices for access control in security highlight the significance of managing session timeouts to prevent unauthorized access<sup>3</sup>.

\* Industry standards and guidelines often recommend session timeouts as a critical security control to protect against unauthorized access<sup>4</sup>.

#### NEW QUESTION # 70

Which architecture deliverable identifies the organization's tolerance to security issues and how the organization plans to react if a security issue occurs?

- A. Policy Compliance Analysis
- B. Business Requirements
- **C. Risk Mitigation Plan**
- D. Threat Modeling Artifacts

**Answer: C**

#### NEW QUESTION # 71

Which category classifies identified threats that have defenses in place and do not expose the application to exploits?

- A. Partially Mitigated Threat
- **B. Fully Mitigated Threat**
- C. Threat Profile
- D. Unmitigated Threats

**Answer: B**

#### NEW QUESTION # 72

Company leadership has contracted with a security firm to evaluate the vulnerability of all externally facing enterprise applications via automated and manual system interactions. Which security testing technique is being used?

- A. Source-code fault injection
- **B. Penetration testing**
- C. Source-code analysis
- D. Properly-based-testing

**Answer: B**

Explanation:

The security testing technique that involves evaluating the vulnerability of all externally facing enterprise applications through both automated and manual system interactions is known as Penetration Testing. This method simulates real-world attacks on systems to identify potential vulnerabilities that could be exploited by attackers. It is a proactive approach to discover security weaknesses before they can be exploited in a real attack scenario. Penetration testing can include a variety of methods such as network scanning, application testing, and social engineering tactics to ensure a comprehensive security evaluation.

: The concept of Penetration Testing as a method for evaluating vulnerabilities aligns with industry standards and practices, as detailed in resources from security-focused organizations and literature<sup>1</sup>.

### NEW QUESTION # 73

The security team is reviewing whether changes or open issues exist that would affect requirements for handling personal information documented in earlier phases of the development life cycle. Which activity of the Ship SDL phase is being performed?

- A. Final privacy review
- B. Final security review
- C. Vulnerability scan
- D. Open-source licensing review

**Answer: A**

Explanation:

The activity being performed is the final privacy review. This step is crucial in the Ship phase of the Security Development Lifecycle (SDL), where the security team assesses if there are any changes or unresolved issues that could impact the requirements for handling personal information. These requirements are typically documented in the earlier stages of the development lifecycle, and the final privacy review ensures that the software complies with these requirements before release.

: The explanation is based on the best practices outlined in the SDL Activities and Best Practices, which detail the importance of conducting a final privacy review during the Ship phase to ensure that all privacy issues have been addressed<sup>12</sup>.
