In this Desktop-based WGU Secure-Software-Design practice exam software, you will enjoy the opportunity to self-exam your preparation. The chance to customize the WGU Secure Software Design (KEO1) Exam (Secure-Software-Design) practice exams according to the time and types of WGU Secure Software Design (KEO1) Exam (Secure-Software-Design) practice test questions will contribute to your ease. This format operates only on Windows-based devices. But what is helpful is that it functions without an active internet connection. It copies the exact pattern and style of the real WGU Secure-Software-Design Exam to make your preparation productive and relevant.

In order to help you save more time, we will transfer Secure-Software-Design test guide to you within 10 minutes online after your payment and guarantee that you can study these Secure-Software-Design training materials as soon as possible to avoid time waste. We believe that time is the most valuable things in the world. This is why we are dedicated to improve your study efficiency and production. Here are some advantages of our Secure-Software-Design study question and we would appreciate that you can have a look to our Secure-Software-Design questions.

Test Labs

Many candidates failed exam before. They have no confidence for next exam and they also hesitate if they have to purchase valid Secure-Software-Design brain dumps materials or if dumps are actually valid. Now I advise you download our free demo before you are determined to buy. Our free demo is a little of the real test, you can see several questions answers and explanations. You will know the validity of WGU Secure-Software-Design Brain Dumps materials.

WGUSecure Software Design (KEO1) Exam Sample Questions (Q79-Q84):

NEW QUESTION # 79

In which step of the PASTA threat modeling methodology is vulnerability and exploit analysis performed?

- A. Application decomposition
- **B. Attack modeling**
- C. Define objectives
- D. Define technical scope

Answer: B

Explanation:

In the PASTA (Process for Attack Simulation and Threat Analysis) threat modeling methodology, vulnerability and exploit analysis is performed during the Attack modeling step. This step involves identifying potential threats and vulnerabilities within the system and understanding how they could be exploited.

* Attack modeling is a critical phase where the focus is on simulating attacks based on identified vulnerabilities. It allows for a deep understanding of the threats in the context of the application's architecture and system design.

* During this phase, security analysts use their knowledge of the system's technical scope and application decomposition to simulate how an attacker could exploit the system's vulnerabilities. This helps in prioritizing the risks and planning appropriate mitigation strategies.

* The goal of attack modeling is not just to identify vulnerabilities but also to understand the potential impact of exploits on the system and the business, which is essential for developing a robust security posture.

: The information provided is aligned with the PASTA methodology as described in resources such as VerSprite1 and the OWASP Foundation2. These sources detail the seven stages of PASTA, with attack modeling being a key component of the process.

NEW QUESTION # 80

Which software control test examines an application from a user perspective by providing a wide variety of input scenarios and inspecting the output?

- **A. Black box**
- B. White box
- C. Dynamic
- D. Static

Answer: A

Explanation:

The software control test that examines an application from a user perspective by providing a wide variety of input scenarios and inspecting the output is known as black box testing. This testing method focuses on the functionality of the application rather than its internal structures or workings. Testers provide inputs and examine outputs without knowing how and where the inputs are worked upon. It's designed to test the system's external behavior.

* Black box testing is used to verify that the system meets the requirements and behaves as expected in various scenarios, including edge cases and incorrect input data. It helps in identifying discrepancies between the system's actual functionality and its specified requirements.

* This type of testing is applicable across various levels of software testing, including unit, integration, system, and acceptance testing. It is particularly useful for validating user stories and use cases during the software development process.

* Since black box testing treats the software as a "black box", it does not require the tester to have knowledge of the programming languages or the system's implementation. This allows testers to objectively test the software's behavior and performance.

: The concept of black box testing is well-documented and is a standard practice in secure software design, as outlined by sources such as LambdaTest1 and other industry best practices.

NEW QUESTION # 81

Which software development model starts by specifying and implementing just a part of the software, which is then reviewed and identifies further requirements that are implemented by repeating the cycle?

- A. Implementation
- B. Waterfall
- C. Code and fix
- **D. Iterative**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Iterative software development model fits this description. It involves specifying and implementing a portion of the software, reviewing it, gathering feedback, and refining or adding requirements in successive cycles. This approach supports evolving requirements and continuous improvement. Iterative models contrast with Waterfall (C), which is linear and sequential, with no repetition of phases. "Code and fix" (D) is an informal, ad hoc process lacking formal review cycles. Implementation (B) is a phase, not a model. The iterative approach is advocated in ISO/IEC 12207 and NIST guidelines for secure development, as it allows early detection and remediation of security issues by incremental design and testing.

NEW QUESTION # 82

Which secure coding best practice says to only use tested and approved components and use task-specific, built-in APIs to conduct operating system functions?

- A. Data Protection
- **B. General Coding Practices**
- C. Session Management
- D. Authentication and Password Management

Answer: B

NEW QUESTION # 83

The security team is identifying technical resources that will be needed to perform the final product security review. Which step of the final product security review process are they in?

- **A. Assess Resource Availability**
- B. Identify Feature Eligibility
- C. Release and Ship
- D. Evaluate and Plan for Remediation

Answer: A

NEW QUESTION # 84
