We are pleased to inform you that we have engaged in this business for over ten years with our Supermicro MI300X GPU Service Specialist (SMI300XS) Exam SMI300XS exam questions. Because of our experience, we are well qualified to take care of your worried about the SMI300XS Preparation exam and smooth your process with successful passing results.

How to pass the SMI300XS exam successfully and quickly? The answer lies in our valid and excellent SMI300XS training guide. We have already prepared our SMI300XS training materials for you. They are professional SMI300XS practice material under warranty. Accompanied with acceptable prices for your reference, all our SMI300XS Exam Materials with three versions are compiled by professional experts in this area more than ten years long.

Hot SMI300XS Cost Effective Dumps - How to Prepare for Supermicro SMI300XS Exam

We can confidently say that our SMI300XS training quiz will help you. First of all, our company is constantly improving our SMI300XS exam materials according to the needs of users. As you can see that there are three versions of our SMI300XS learning questions on our website for you to choose: the PDF, Software and APP online. As long as you have a try on our SMI300XS study prep, you will want our SMI300XS study materials to prepare for the exam for sure.

Supermicro MI300X GPU Service Specialist (SMI300XS) Exam Sample Questions (Q16-Q21):

NEW QUESTION # 16

Which cables need to be reconnected after installing the NVMe backplane?

- A. Only the Power Cable
- **B. i2C Cable, SAS Cable, Power Cable**
- C. Only the i2C Cable
- D. Only the SAS Cable

Answer: B

Explanation:

NVMe Backplane Connection Requirements in Supermicro MI300X Systems

After installing the NVMe backplane, the following cables must be reconnected for proper system functionality:

* i2C Cable (Inter-Integrated Circuit Cable)

* Responsible for data communication, sensor monitoring, and system management functions.

* Ensures that storage devices are properly detected by the motherboard.

* SAS Cable (Serial Attached SCSI)

* Used for high-speed storage connectivity in hybrid NVMe/SAS systems.

* Ensures data integrity and fast data transfers between SSDs and the system controller.

* Power Cable

* Supplies power to the NVMe backplane and connected drives.

* Without this, NVMe drives will not receive power and will not be detected by the system.

Why Other Options Are Incorrect?

* B (Only the SAS Cable) # While the SAS cable is important, the power cable and i2C cable are also required.

* C (Only the i2C Cable) # The i2C cable is not sufficient by itself; the NVMe backplane needs both power and data connections.

* D (Only the Power Cable) # Power is needed, but data connectivity through SAS and i2C is essential for full functionality.

Official Documentation Reference:

* Supermicro NVMe Storage System Guide confirms that i2C, SAS, and power cables must all be reconnected after NVMe backplane installation.

NEW QUESTION # 17

Before removing the midplane from the AS-8125GS-TNMR2, you must disengage all the power supply units (PSUs) and dummy PSUs, as well as the PCIe tray, motherboard tray, and GPU tray. True or False?

- **A. True**
- B. False

Answer: A

Explanation:

Removing the midplane in a Supermicro MI300X GPU system requires disengaging multiple system trays and power components beforehand.

Why is this necessary?

* Power must be fully disengaged before midplane removal

* The midplane is directly connected to power distribution units (PDUs).

* If power is not removed, it can cause short circuits or hardware damage.

* PCIe, motherboard, and GPU trays block access

* These trays must be disengaged before removing the midplane, as they contain components directly connected to it.

* Dummy PSUs must also be removed

* Even inactive PSUs contain locking mechanisms that must be disengaged.

Official Documentation Reference:

* Supermicro AS-8125GS-TNMR2 System Removal Guide confirms that PSUs, dummy PSUs, PCIe trays, motherboard trays, and GPU trays must be removed before handling the midplane.

NEW QUESTION # 18

Where is the one screw that needs to be removed in order to remove the AOM bracket?

- **A. On the side of the motherboard tray**
- B. On top of the fan tray

- C. On the rear of the power supply
- D. On top of the hard drive tray

Answer: A

Explanation:

Understanding the AOM Bracket in Supermicro MI300X Systems

The AOM (Add-On Module) bracket is used to hold optional expansion cards, such as:

- * RAID controllers
- * Additional network interface cards (NICs)
- * BMC/IPMI modules for system management

Why is the Screw Located on the Side of the Motherboard Tray?

- * The AOM bracket is secured to the chassis via a single screw that is located on the side of the motherboard tray.
- * This design keeps the bracket firmly in place while still allowing for easy removal when needed.
- * Removing the screw first prevents unnecessary strain on the bracket and ensures safe removal of the AOM card.

Why Other Options Are Incorrect?

- * A (On top of the hard drive tray) # The hard drive tray does not secure the AOM bracket.
- * B (On top of the fan tray) # Fans do not hold down the AOM bracket.
- * D (On the rear of the power supply) # The power supply is not directly connected to the AOM bracket.

Official Documentation Reference:

- * Supermicro AS-8125GS-TNMR2 Expansion Module Guide specifies that the AOM bracket is secured by a single screw located on the side of the motherboard tray.

NEW QUESTION # 19

In the motherboard tray, the AOM bracket is partially covered by the support bar. So, you'll need to remove the support bar first before you can remove the AOM bracket. True or False?

- **A. True**
- B. False

Answer: A

Explanation:

Why Must the Support Bar Be Removed First?

* The support bars are reinforcement structures inside the chassis that provide mechanical stability to components, including the AOM bracket.

* Since the AOM bracket is partially covered by the support bar, you must remove the bar first to gain full access.

Step-by-Step Removal Process:

#Step 1: Remove the screws securing the support bar. #Step 2: Carefully lift and remove the support bar without tilting it. #Step 3: Now, unscrew and remove the AOM bracket.

Why is False Incorrect?

* If False were correct, it would suggest that the AOM bracket can be removed without touching the support bar, which is not possible due to obstruction.

Official Documentation Reference:

- * Supermicro AS-8125GS-TNMR2 Disassembly Manual confirms that the support bar must be removed first before accessing the AOM bracket.

NEW QUESTION # 20

Once you remove the midplane lid from the AS-8125GS-TNMR2 system, how many total screws must be removed from the sides of the chassis in order to remove the midplane bracket?

- **A. 4 screws total (2 on each side of the chassis)**
- B. 8 screws total (4 on each side of the chassis)
- C. 6 screws total (3 on each side of the chassis)
- D. 2 screws total (1 on each side of the chassis)

Answer: A

Explanation:

To remove the midplane bracket in the AS-8125GS-TNMR2 system, you must remove 4 screws total (2 on each side of the chassis). Why 4 screws?

- * The midplane bracket is secured by 2 screws per side to maintain its structural integrity.
- * Loosening all 4 screws allows safe removal without excessive force.
- * Forcing the bracket without removing the screws risks damaging the mounting points.

Incorrect Answers Explained:

- * A (2 screws total) # Not enough, as screws on both sides must be removed.
- * C (8 screws total) # More than necessary; only 4 screws hold the midplane bracket.
- * D (6 screws total) # Incorrect count; only 2 screws per side are required.

Official Documentation Reference:

- * Supermicro AS-8125GS-TNMR2 Installation Guide explicitly states that two screws on each side (4 total) must be removed to release the midplane bracket.
