ISTQB CT-PT Exam Syllabus Topics:

Topic	Details
Topic 1	• The Concept of Load Generation: This section of the exam measures the skills of Software Test Analysts and discusses how representative loads are modeled and produced to simulate user or process behavior. It explores methods such as user interface inputs, crowdsourcing, API-based calls, or protocol capture and playback, emphasizing the need for repeatable loads that accurately reflect real-world conditions.
Topic 2	• Testing Types in Performance Testing: This section of the exam introduces the distinction between static and dynamic performance testing. It shows how reviews of requirements, architecture, and code can identify risks before coding is complete, and how runtime checks of resource utilization and response times reveal issues that only appear when the system is in operation.
Topic 3	• Common Failures in Performance Testing and Their Causes: This section of the exam measures the skills of Performance Engineers and outlines frequent failure modes, including slow responses at various load levels, degraded performance over time, and system crashes under peak conditions. It provides examples of underlying causes such as resource leaks, insufficient capacity, and poor handling of spikes or concurrency, illustrating why robust planning and monitoring are crucial for reliable performance.
Topic 4	• Types of Performance Testing: This section of the exam measures the skills of Software Test Analysts and covers various approaches such as load, stress, scalability, spike, endurance, concurrency, and capacity testing. It explains how each type evaluates system behavior under different conditions, helping testers and stakeholders understand how the system handles both expected and extreme usage scenarios.

ISTQB Certified Tester - Performance Testing Sample Questions (Q28-Q33):

NEW QUESTION # 28

What should be captured for batch processing performance metrics?

- A. Average percentage of network latency
- B. Number of records deleted
- **C. Throughput and wait times**
- D. Number of concurrent virtual users

Answer: C

Explanation:

For batch processing performance metrics, the two most important factors are:

Throughput - Measures the number of transactions processed over time.

Wait times - Evaluates delays in processing batches.

Option B (Number of records deleted) is irrelevant unless batch processing specifically involves deletions.

Option C (Network latency percentage) applies to real-time transaction processing, not batch jobs.

Option D (Concurrent virtual users) applies more to load testing rather than batch performance.

NEW QUESTION # 29

Stakeholders were unhappy with previous performance test results, which indicated that the adjustments were not made fast enough and engine stall was probable. The developers have now made changes that they believe will significantly improve the performance of the adjustments.

What should you do to ensure the performance test objectives have been properly defined before you run the next set of performance tests?

- A. Realign performance test objectives with all stakeholders to meet time-to-market goals.
- B. Adjust stakeholder expectations to be more aligned with the reality of the previous test results.
- C. Realign performance test objectives with business stakeholders to meet project milestone dates.
- **D. Understand the delta between the results from previous performance tests and the results from the expected performance improvements.**

Answer: D

Explanation:

Before running the next set of performance tests, it is crucial to understand the differences (delta) between the previous test results and the expected improvements. This ensures that:

The changes made by developers are properly validated.

Performance objectives are aligned with measurable improvements.

Option B (Adjust stakeholder expectations) is incorrect, as performance testing should focus on real data rather than adjusting expectations.

Option C and D (Realign objectives for milestones or time-to-market goals) are incorrect because test objectives should focus on technical accuracy rather than schedule constraints.

NEW QUESTION # 30

Which of the following is considered a common database protocol?

- A. MMS
- **B. ODBC**
- C. SMP

- D. JUNIT

Answer: B

Explanation:

ODBC (Open Database Connectivity) is a standard database protocol that enables applications to connect to and interact with databases regardless of vendor specifications.

Option B (JUNIT) is a unit testing framework, not a database protocol.

Option C (SMP - Symmetric Multiprocessing) relates to CPU architecture, not databases.

Option D (MMS - Multimedia Messaging Service) is related to mobile messaging, not database communication.

NEW QUESTION # 31

You have run a load test. When examining the metrics, you see that the virtual users experienced many timeouts and excessive wait times. The system throughput metrics exceeded expected results, even during peak times.

Based on your analysis, what conclusion should you draw?

- A. Processing speed is too slow.
- B. Network infrastructure should be investigated.
- C. New test data is needed.
- D. Virtual users are exhibiting impatient behavior.

Answer: A

Explanation:

If timeouts and excessive wait times occur, but throughput is high, this suggests that the system is unable to process requests fast enough. This points to slow processing speed due to CPU bottlenecks, memory limitations, or inefficient database queries.

Option A (Network infrastructure investigation) would be relevant if throughput was low or variable.

Option C (Impatient virtual users) is irrelevant; virtual users follow scripted behaviors.

Option D (New test data) does not address the core issue.

NEW QUESTION # 32

Which of the following is a best practice to include in performance test scripts when verifying results?

- A. Add transaction timers to collect response times.
- B. Hold the development team accountable for system performance.
- C. Verify that correct information was added to the database.
- D. Increase the number of scripts executed to provide greater coverage.

Answer: C

Explanation:

One of the best practices in performance test scripting is to validate that correct data is recorded in the database after execution. This ensures that performance issues do not impact data integrity.

Option A (Increasing the number of scripts) may provide more coverage but does not verify accuracy.

Option C (Adding transaction timers) is useful for performance monitoring but does not ensure correct data entry.

Option D (Holding the development team accountable) is a management responsibility, not a scripting best practice.
