2025 XK0-005 Latest Dumps Free - CompTIA CompTIA Linux+ Certification Exam - The Best XK0-005 Online Training Materials

If you want to get CompTIA certification, you can save a lot of time and effort with our XK0-005 study materials. We know that you must have a lot of other things to do, and our products will relieve your concerns in some ways. First of all, XK0-005 exam materials will combine your fragmented time for greater effectiveness, and secondly, you can use the shortest time to pass the exam to get your desired certification. Our XK0-005 Study Materials allow you to improve your competitiveness. With the help of our XK0-005 study guide, you will be the best star better than others

CompTIA Linux+ Certification Exam Sample Questions (Q777-Q782):

NEW QUESTION # 777

After installing a new version of a package, a systems administrator notices a new version of the corresponding service file was installed. In order to use the new version of the service file, which of the following commands must be issued FIRST?

- A. systemctl stop
- B. systemctl daemon-reload
- C. systemctl reinstall
- D. systemctl status

Answer: B

Explanation:
Explanation

After installing a new version of a package that includes a new version of the corresponding service file, the `systemctl daemon-reload` command must be issued first in order to use the new version of the service file.

This command will reload the `systemd` manager configuration and read all unit files that have changed on disk.

This will ensure that `systemd` recognizes the new service file and applies its settings correctly. The `systemctl status` command will display information about a service unit, but it will not reload the configuration. The `systemctl stop` command will stop a service unit, but it will not reload the configuration. The `systemctl reinstall` command does not exist. References: CompTIA Linux+ (XK0-005) Certification Study Guide, Chapter 17: System Maintenance and Operation, page 518.

NEW QUESTION # 778

Based on an organization's new cybersecurity policies, an administrator has been instructed to ensure that, by default, all new users and groups that are created fall within the specified values below.

To which of the following configuration files will the required changes need to be made?

- A. `/etc/security/limits.conf`
- B. `/etc/profile`
- C. `/etc/default/useradd`
- D. `/etc/login.defs`

Answer: D

Explanation:

The required changes need to be made to the `/etc/login.defs` configuration file. The `/etc/login.defs` file defines the default values for user and group IDs, passwords, shells, and other parameters for user and group creation.

The file contains the directives `UID_MIN`, `UID_MAX`, `GID_MIN`, and `GID_MAX`, which set the minimum and maximum values for automatic user and group ID selection. The administrator can edit this file and change the values to match the organization's new cybersecurity policies. This is the correct file to modify to accomplish the task. The other options are incorrect because they either do not affect the user and group IDs (

`/etc/security/limits.conf` or `/etc/profile`) or do not set the default values (`/etc/default`

`/useradd`). References: CompTIA Linux+ (XK0-005) Certification Study Guide, Chapter 15: Managing Users and Groups, page 463.

NEW QUESTION # 779

An administrator accidentally installed the `httpd` RPM package along with several dependencies. Which of the following options is the best way for the administrator to revert the package installation?

- A. `apt-get clean`
- B. `dnf clean all`
- C. `yum history undo last`
- D. `rpm -e httpd`

Answer: C

Explanation:

The `yum history undo last` command allows the administrator to undo the most recent transaction, effectively removing the `httpd` package and any installed dependencies. This is the safest and easiest way to revert package installations in RPM-based systems using `yum`.

NEW QUESTION # 780

A user sends a request to access a virtual server via SSH. Which of the following commands is used to open the SSH standard port?

- A. `iptables -A INPUT -p tcp --dport sshd -j ACCEPT`
- B. `firewalld-cmd --permanent --add-port=22/tcp`
- C. `firewalld-cmd --remove-service=ssh --permanent`
- D. `iptables-save | grep dport-22/tcp`

Answer: B

Explanation:

The correct way to open a port for SSH using firewall is:

bash

firewall-cmd --permanent --add-port=22/tcp

* This command allows TCP traffic on port 22 (the default port for SSH).

* Option B only displays saved rules and doesn't open the port.

* Option C contains incorrect syntax: --dport sshd is invalid (sshd is a daemon, not a port number).

* Option D removes the SSH service from the firewall, which is the opposite of the requirement.

Reference: CompTIA Linux+ XK0-005 Official Study Guide, Domain 3.0 - Security

"Use firewall-cmd --permanent --add-port=22/tcp to allow SSH traffic through firewall."

NEW QUESTION # 781

A Linux administrator has installed a web server, a database server, and a web application on a server. The web application should be active in order to render the web pages. After the administrator restarts the server, the website displays the following message in the browser: Error establishing a database connection. The Linux administrator reviews the following relevant output from the systemd init files:

The administrator needs to ensure that the database is available before the web application is started. Which of the following should the administrator add to the HTTP server .service file to accomplish this task?

- A. TRIGGERS=mariadb.service
- B. WANTEDBY=mariadb.service
- C. ONFAILURE=mariadb.service
- D. **REQUIRES=mariadb.service**

Answer: D

Explanation:

The administrator should add REQUIRES=mariadb.service to the HTTP server .service file to ensure that the database is available before the web application is started. This directive specifies that the HTTP server unit requires the MariaDB server unit to be started before it can run. If the MariaDB server unit fails to start or stops for any reason, the HTTP server unit will also fail or stop. This way, the dependency between the web application and the database is enforced by systemd.

The other options are not correct directives for accomplishing this task. TRIGGERS=mariadb.service is not a valid directive in systemd unit files. ONFAILURE=mariadb.service means that the HTTP server unit will start only if the MariaDB server unit fails, which is not what we want. WANTEDBY=mariadb.service means that the HTTP server unit will be started when the MariaDB server unit is enabled, but it does not imply a strong dependency or ordering relationship between them. References: CompTIA Linux+ (XK0-005) Certification Study Guide, Chapter 10: Managing Services with systemd; systemd.unit(5) - Linux manual page

NEW QUESTION # 782

.....

From the view of specialized examination point, it is necessary to teach you tips about the exam. You need to outsmart, and do not give your future the chance of failure. Prep4sureGuide is a great resource site. It includes CompTIA XK0-005 Exam Materials, study materials and technical materials, as well as exam training and detailed explanation and answers. The website which provide exam information are surged in recent years. This may cause you clueless when you prepare the CompTIA XK0-005 Exam. Prep4sureGuide's CompTIA XK0-005 exam training materials are effective training materials that proven by professionals and the candidates who passed the exam. It can help you to pass the exam certification easily.
