Free PDF 2025 CompTIA XK0-005 Newest Vce Format

XK0-005 study materials can expedite your review process, inculcate your knowledge of the exam and last but not the least, speed up your pace of review dramatically. The finicky points can be solved effectively by using our XK0-005 exam questions. With a high pass rate as 98% to 100% in this career, we have been the leader in this market and helped tens of thousands of our loyal customers pass the exams successfully. Just come to buy our XK0-005 learning guide and you will love it.

CompTIA Linux+ Certification Exam Sample Questions (Q346-Q351):

NEW QUESTION # 346

A systems administrator wants to test the route between IP address 10.0.2.15 and IP address 192.168.1.40. Which of the following commands will accomplish this task?

- A. route -n 192.168.1.40 from 10.0.2.15
- B. ip route get 192.163.1.40 from 10.0.2.15
- C. route -e get to 192.168.1.40 from 10.0.2.15
- D. ip route 192.169.1.40 to 10.0.2.15

Answer: B

Explanation:

The command ip route get 192.168.1.40 from 10.0.2.15 will test the route between the IP address 10.0.2.15 and the IP address 192.168.1.40. The ip route get command shows the routing decision for a given destination and source address. This is the correct command to accomplish the task. The other options are incorrect because they either use the wrong commands (route instead of ip route), the wrong options (-e or -n instead of get), or the wrong syntax (to instead of from). Reference: CompTIA Linux+ (XK0-

NEW QUESTION # 347

Users have been unable to save documents to /home/tmp/temp and have been receiving the following error:

Path not found

A junior technician checks the locations and sees that /home/tmp/tempa was accidentally created instead of /home/tmp/temp. Which of the following commands should the technician use to fix this issue?

- A. ls /home/tmp/tempa
- B. cp /home/tmp/tempa /home/tmp/temp
- C. mv /home/tmp/tempa /home/tmp/temp
- D. cd /tmp/tmp/tempa

Answer: C

NEW QUESTION # 348

A systems administrator installed a new software program on a Linux server. When the systems administrator tries to run the program, the following message appears on the screen.

Hardware virtualization support is not available on this system.
Either is not present or disabled in the system's BIOS

Which of the following commands will allow the systems administrator to check whether the system supports virtualization?

- A. sysctl -a
- B. lscpu
- C. cat /sys/device/system/cpu/possible
- D. dmidecode -s system-version

Answer: B

Explanation:

Explanation

The command that will allow the systems administrator to check whether the system supports virtualization is lscpu. This command will display information about the CPU architecture, such as the number of CPUs, cores, sockets, threads, model name, frequency, cache size, and flags. One of the flags is vmx (for Intel processors) or svm (for AMD processors), which indicates that the CPU supports hardware virtualization. If the flag is present, it means that the system supports virtualization. If the flag is absent, it means that the system does not support virtualization or that it is disabled in the BIOS settings.

The other options are not correct commands for checking whether the system supports virtualization. The dmidecode -s system-version command will display the version of the system, such as the product name or serial number, but not the CPU information. The sysctl -a command will display all the kernel parameters, but not the CPU flags. The cat /sys/devices/system/cpu/possible command will display the range of possible CPUs that can be online or offline, but not the CPU features. References: lscpu(1) - Linux manual page; How To Check If Virtualization is Enabled in Windows 10 / 11

NEW QUESTION # 349

An administrator accidentally deleted the /boot/vmlinuz file and must resolve the issue before the server is rebooted. Which of the following commands should the administrator use to identify the correct

- A. yum -y update; shutdown -r now
- B. rpm -qa | grep kernel; uname -a
- C. cat /etc/centos-release; rpm -Uvh --nodeps
- D. telinit 1; restorecon -Rv /boot

Answer: B

NEW QUESTION # 350

A user generated a pair of private-public keys on a workstation. Which of the following commands will allow the user to upload the public key to a remote server and enable passwordless login?

- A. `ssh-copy-id user@server`
- B. `rsync ~/.ssh/ user@server:~/`
- C. `ssh-add user server`
- D. `scp ~/.ssh/id_rsa user@server:~/`

Answer: A

Explanation:

The command `ssh-copy-id user@server` will allow the user to upload the public key to a remote server and enable passwordless login. The `ssh-copy-id` command is a tool for copying the public key to a remote server and appending it to the `authorized_keys` file, which is used for public key authentication. The command will also set the appropriate permissions on the remote server to ensure the security of the key. The command `ssh-copy-id user@server` will copy the public key of the user to the server and allow the user to log in without a password. This is the correct command to use for this task. The other options are incorrect because they either do not copy the public key (`scp`, `rsync`, or `ssh-add`) or do not use the correct syntax (`scp ~/.ssh/id_rsa user@server:~/` instead of `scp ~/.ssh/id_rsa.pub user@server:~/` or `rsync ~/.ssh/ user@server:~/` instead of `rsync ~/.ssh/id_rsa.pub user@server:~/`).
